

A Pediatrician with Autistic Grandchildren

F. Edward Yazbak, MD was a pediatrician in Rhode Island for 35 years where he assisted the Dep't. of Health in coordinating mass vaccination campaigns. He is also a member of the American Academy of Pediatrics. Two of his grandchildren became autistic after receiving the vaccinations he had promoted during his professional life. He is now a critic of vaccine policy:

"The group of children we have now is the most vaccinated group ever. We have never seen more children vaccinated with more vaccines than the ones that are living right now. But more importantly, and this is where my study comes in, the mothers of these children are the most vaccinated ever, and have the most immune diseases ever in the history of the world," says Dr. Yazbak.

In a voice laden with emotion, Dr. Yazbak showed a slide of his grandson eight weeks after the MMR saying, "This picture shows the full throws of an immune insult. Eight weeks after his MMR shot he is gone. He was diagnosed with... autistic enterocolitis."

His grandson's vaccine injury has inspired Dr. Yazbak to find out why some children are predisposed to developing autism.
